Basic information on the AI application

Quick facts about the use case

Describe the business problem and the general application case in 2-5 sentences.

[---Insert answer---].

Can the use case be considered “prohibited”, “high risk” or “AI with specific transparency obligations” according to the EU’s proposed regulation of AI application (European Commission 2021)?

[---Insert answer---].

Are there any additional laws or standards that need to be complied with? Are use case specific governance or oversight mechanisms necessary?

[---Insert answer---].

- The draft is available online at https://eur-lex.europa.eu/resource.html?uri=cellar:e0649735-a372-11eb-9585-01aa75ed71a1.0001.02/DOC_1&format=PDF
- The definition of prohibited AI applications can be found in: TITLE II, Article 5
- The definition of high-risk AI applications can be found in: TITLE III, Chapter 1, Article 6
- The definition of AI applications with specific transparency obligations can be found in: TITLE IV; Article 52

Are there any known risks associated with the use case?

[---Insert answer---].

How is the AI application integrated into the business process in the company? If the AI application was created for an external customer: How is the AI application integrated into the business process by the customer?

[---Insert answer---].

Quick facts about the training data and the data that will be analyzed

What kind of data is being processed? Where does it come from?

[---Insert answer---].

Where does the training data come from? What does the training data look like?

[---Insert answer---].

Is personal data processed by the AI? Does the General Data Protection Regulation (GDPR) (European Parliament 2016) or any other privacy regulation apply?

[---Insert answer---].

Can the data be distributed to other organizations and people freely or do restrictions regarding the distribution apply? Are there confidentiality agreements with clients and/or developers in place?

[---Insert answer---].

Are there any additional constraints (regulatory or otherwise) that need to be complied with? Are data specific governance or oversight mechanisms necessary?

[---Insert answer---].

Quick facts about the AI application

What is the goal of the AI application?

[---Insert answer---].

Do the AI models involved exhibit any potentially unwanted behavior (i.e. Blackbox characteristic, biases, ...)?

[---Insert answer---].

What type of AI models are being used?

[---Insert answer---].

Are any of the AI models re-trained throughout the lifecycle of the AI application? If yes, is the training done automatically or with human supervision?

[---Insert answer---].

How independently do the AI models make decisions? (For the response that you have chosen, please provide some information on which decisions and actions are automated and which decisions and actions are implemented by a human.)

[] The decisions and the subsequent actions are fully autonomous without any human supervision or interaction

Example: A predictive maintenance system that schedules the necessary repairs shortly before components of a machine fail. The AI informs the factory workers after the appointment with the technician has been scheduled.

[] The decisions and the subsequent actions are primarily automated with limited human supervision or interaction

Example: A predictive maintenance system detects that a component in a machine will fail soon, asks the factory workers for permission to schedule an appointment at a certain time, and automatically schedules an appointment with the technician.

[] The decisions and the subsequent actions are primarily made by a human with a limited degree of support from an AI model

Example: A predictive maintenance system detects that a component in a machine will fail soon. The predictive maintenance system notifies the factory worker and asks the factory worker to schedule the repairs with the technicians.

What does the structure of the AI application look like?

Please draw a UML chart. Please indicate the following components clearly:

[---Insert answer---]

Quick facts about other risks associated with the use case, the AI application, and the data

Are there any other significant or noteworthy risks associated with the use case, the AI application, and the data? Examples: Intellectual property considerations, competitive aspects, ...

[---Insert answer---].

Quick facts about the documentation

What is the goal of this documentation? Who is the target audience of this documentation? (Documentation for IT auditors, or users or for developers?)

[---Insert answer---].

What documents does the documentation consist of?

[---Insert answer---].
